

HOW TO IMPROVE CASE AND CARTON SEAL LINE EFFICIENCY

Improving case and carton seal production line efficiency can be a challenge for many plant managers and operators. Find out how the right adhesive, Kizen®, can make it easy.

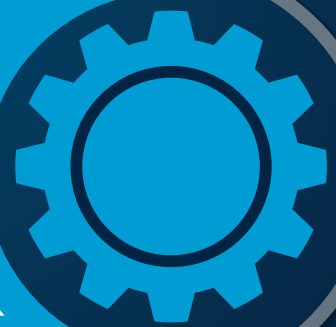

REDUCE POP-OPENS

Kizen decreases the likelihood of pop-opens, which reduces the risk of unplanned downtime. This is because it offers specific adhesion to difficult-to-bond substrates. Production lines keep running smoothly and efficiently.

INCREASE LINE SPEED

With quick set speeds ideal for auto-feed systems, Kizen enables production lines to run faster. This makes it easier for plants to meet high output demands in short time frames.

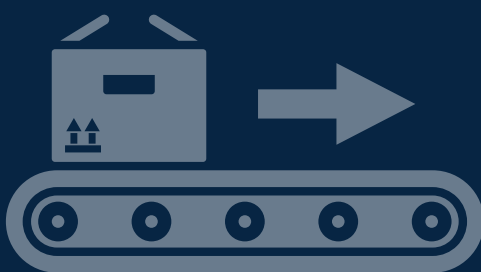

DECREASE MAINTENANCE

Kizen limits adhesive residue on equipment due to its low stringing quality. Additionally, its water white formulation reduces char. This means less downtime is needed for case and carton sealing equipment maintenance.

REDUCE SKUS

Offering a robust processing window, Kizen is able to bond packages across case and carton sealing production lines. This helps plants consolidate SKUs, further streamlining processes.
